

ABOUT MEZURO

Mezuro project aims provide a platform to compare projects and metric techniques, teach how to use metrics through configurations, analyze code, avoid technical debts, and disseminate code metrics usage and understanding. Here you can try the front-end for the [Kalibro Web Service](#). It is intended to be a service where you can evaluate your code quality and, if you want, define wich set of metrics you want to use.

Understanding Code Metrics

This is Mezuro! A **free\libre** web platform for **collaborative** source code **evaluation**.

Here you can evaluate your source code with most of the SCM (Git, Baazar, Mercurial, and SVN), just by giving it's URL. For now you can evaluate **C**, **C++**, **Java** source code, but soon we hope to support more languages!

Mezuro is under development. Try it and give us your [feedback](#).
